PROFESSIONAL SUMMARY

Aspiring Cybersecurity and Cloud Security professional (PGCP-ITISS, CDAC-ACTS Pune; B. Tech CSE) with hands-on experience in Linux, Python, networking, and AWS security. Built an event-driven AWS incident-response pipeline (GuardDuty, EventBridge, Lambda) that automates forensic snapshotting, EC2 isolation, and alerting. Seeking entry-level roles in cybersecurity, SOC operations, or cloud security.

TECHNICAL SKILLS

Cloud & Security: AWS, Amazon GuardDuty, EventBridge, Lambda, EC2, EBS, SNS, IAM, CloudWatch Logs, Cloud Security, SIEM (Wazuh), Threat Detection, Incident Response, Security Containment, Vulnerability Assessment, Ethical Hacking

Networking: TCP/IP, DNS, Firewalls, Network Troubleshooting, Nmap, Wireshark, Burp Suite

Operating Systems: Linux Administration, Linux Shell Scripting, Windows, VirtualBox/VMware

Programming & Scripting: Python, Bash, JavaScript, HTML, CSS, boto3, JSON

Tools & Databases: Git, GitHub, MySQL

EDUCATION

Post Graduate Certificate in IT Infrastructure, Systems and Security (PGCP-ITISS)

Feb 2026 – Aug 2026

CDAC-ACTS, Pune | 75.36%

B.Tech in Computer Science and Engineering

Aug 2019 – July 2023

Ballarpur Institute of Technology | CGPA: 8.54

PROJECTS

CloudGuard – Automated AWS Cloud Security & Incident Response

github.com/Ashu-ye/Cloud-Guard

- Engineered an event-driven AWS incident-response pipeline (GuardDuty → EventBridge → Lambda) that automates identification and containment of suspicious EC2 activity via forensic EBS snapshots and security-group isolation.
- Implemented Python/boto3 response orchestration with idempotency checks and dry-run safety controls, plus Amazon SNS alerting and CloudWatch Logs monitoring.

Home SOC Lab – Blue Team Detection & Incident Response Lab

github.com/Ashu-ye/home-soc-lab

- Built a self-hosted SOC lab (VirtualBox: Kali attacker, Ubuntu victim, Wazuh SIEM) and simulated SSH brute-force attacks using Hydra and Nmap, then diagnosed and resolved a Wazuh agent log-source misconfiguration that was suppressing alerts — achieving correlated detection of 600+ authentication-failure events.
- Documented the full build process, troubleshooting log, and a formal incident report following SOC-style reporting conventions, published on GitHub.

Vulnerability Scanner

github.com/Ashu-ye/Vulnerability-Scanner

- Built a custom, multithreaded scanner using Python standard libraries to execute port scanning, banner grabbing, and security header audits.
- Automated real-time vulnerability mapping by integrating live CVE lookups against the NVD database.
